# Ten Indicators of a Warming World

Seven of these indicators would be expected to increase in a warming world and observations show that they are, in fact, increasing. Three would be expected to decrease and they are, in fact, decreasing.

# Nuisance flooding becoming more than a nuisance

FIGURE 4. Local Sea Level Rise and Tidal Flooding, 1970–2012

Sea level has risen by about 3.5 inches globally—but more along the East Coast—since 1970. At Sewells Point, VA, for example, sea level has risen more than eight inches, and at Boston, about five inches. Rising seas mean that communities up and down the East and Gulf Coasts are seeing more days with tidal flooding. Charleston, SC, for example, faced just two to three days with tidal flooding a year in the 1970s. The city now averages 10 or more such days annually.

\*Norfolk statistics recorded at the Sewells Point tide gauge.
